Multiple **facial** technologies

Focused on facial rejuvenation

Fusiomed facial's technologies integrates different rejuvenation procedures:

1. SKINTITE

Unique skin tightening procedure that uses vacuum and delivers radio frequency energy via microneedles below the skin surface in multiple miniscule beams leading to "fractional" heat zones, leaving healthy tissue in between the heated zones. The treatment increases collagen production in two ways; The microneedles cause micro-injuries in the deeper dermis which your body heals with collagen production. The fractional radiofrequency heats up the deeper dermis in 360 degrees around each microneedle tip for further collagen tightening and synthesis.

2. RF SHAPE DEEP VOLUME

Heating only the deep layer of your skin. The epidermis or outer skin layer is not affected. Your body's natural wound healing response causes collagen changes in the deep dermis which results in skin tightening.

3. RF SHAPE SUPERFICIAL

For epidermal and mid dermal skin rejuvenation. The treatment targets the topmost and mid layers of skin in order to stimulate the body's natural restoration processes, resurfacing and boosting collagen and elastin production, creating a younger refreshed appearance.

Why the treatment is considered so effective?

No other procedures offer a similar multi-source radiofrequency treatment. A number of studies throughout the world, published in consumer and medical periodicals have proven the benefits of this widely diffused skin procedures. Their combination make the treatment particularly effective.

What is the skin's appearance immediately after the treatment and what after care is necessary?

Occasionally the treatment results in a redness, which may last few hours. After the treatment slight skin sensitivity may show. To protect and soothe the skin, specific skin care formulations may be advised as a home care regime.

Is the treatment painful?

Generally, treatment with Fusiomed is not considered particularly unpleasant. In some case and especially when SKINTITE procedure is performed some degree of discomfort may be present.

What is the procedure time according to different areas?

Fusiomed technology increases treatment speed due to the simultaneous action of its skin procedures: approximately 30 minutes are needed to treat a full face.

Fusiomed indications:

- Superficial and deep wrinkles
- Sun-damaged skin
- Small wrinkles
- Acne and skin impurities
- Enlarged pores
- Rough and thickened skin
- Hyperpigmentation marks
- Stretch marks
- Acne scars

What are the advantages of Fusiomed over other types of skin rejuvenation procedure?

Skin peeling with acids can be toxic and can cause permanent scarring. Skin peeling using diamond points or laser are highly aggressive for the skin and require anesthesia. Fusiomed offers progressive and consistent results without side effects.

How many treatments are required for substantial results?

Age and skin condition will determine the number of treatments required to achieve the maximum effect. For most common skin conditions a minimum of 6 treatments is usually required. The results are evident from both the skin texture and its appearance after the very first session.
